Name: Dhruv Jonwal

Course: BBA DBE

Objective: Apply the CSS concepts you've learned to enhance your personal resume website — improving its design, layout, and visual appeal using fonts, colours, positioning, and selectors.

Write-Up for Resume Website CSS Assignment

Resume Website Enhancement Using CSS

In this assignment, I enhanced my personal resume website using CSS to improve its design, layout, and overall visual appearance. The objective of this assignment was to apply CSS concepts such as fonts, colours, selectors, spacing, positioning, and layout structuring.

First, I improved the overall layout of the website by adding a navigation bar at the top of the page. The navigation bar allows easy movement between different sections such as About, Education, Skills, Projects, and Contact. I used Flexbox to align the navigation items properly.

I also added a hero section on the homepage which includes my name, course information, and a "View Resume" button that opens my resume PDF. This makes the website look more professional and interactive.

I applied a consistent colour palette across the website to maintain a clean and professional design. Background colours, text colours, and card colours were selected carefully to maintain visual consistency.

I created different sections such as About Me, Education, Skills, Projects, Collection of Specimens, and Contact. Each section was styled using CSS with proper margins, padding, border radius, and box shadow to make the website look structured and visually appealing.

For the Skills and Projects sections, I used card layouts designed using Flexbox. This improved the alignment and spacing of the content. I also used different CSS selectors such as element selectors, class selectors, and ID selectors to organize the styling properly.

I improved text formatting, alignment, spacing, and overall layout to enhance readability and user experience. A footer section was also added at the bottom of the website.

Overall, this assignment helped me understand how CSS styling, layout design, colour combinations, and spacing improve the usability, structure, and visual appeal of a website.
